Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Graph showing On-Resistance ( $R_{DS(on)}$ ) versus Gate-to-Source Voltage ( $V_{GS}$ ) for the 2N7000 MOSFET at  $I_D = 5\text{ A}$ . The curves are plotted for two temperatures:  $T_J = 125\text{ }^{\circ}\text{C}$  (upper curve) and  $T_J = 25\text{ }^{\circ}\text{C}$  (lower curve). The on-resistance decreases sharply as  $V_{GS}$  increases from 1V to 2V, then levels off. The on-resistance is higher at  $125\text{ }^{\circ}\text{C}$  than at  $25\text{ }^{\circ}\text{C}$ .

Figure 10 is a Power Dissipation Capability graph for the 2N7000 MOSFET. The y-axis represents Drain Current ( $I_D$ ) in Amperes (A) on a logarithmic scale from 0.01 to 100. The x-axis represents Drain-to-Source Voltage ( $V_{DS}$ ) in Volts (V) on a logarithmic scale from 0.1 to 100. The graph shows the relationship between  $I_D$  and  $V_{DS}$  for different pulse widths and ambient temperature ( $T_A = 25^\circ\text{C}$ ).

The solid line represents the DC power dissipation limit, which is limited by  $R_{DS(on)}$  at low  $V_{DS}$  and by  $BVDSS$  at high  $V_{DS}$ . The dashed lines represent the pulsed power dissipation limits for various pulse widths: 100  $\mu\text{s}$ , 1 ms, 10 ms, 100 ms, 1 s, and 10 s. The ambient temperature is specified as  $T_A = 25^\circ\text{C}$  for a single pulse.

\* The power dissipation  $P_D$  is based on  $T_{J(max.)} = 150$  °C, using junction-to-case thermal resistance, and is more useful in settling the upper dissipation limit for cases where additional heatsinking is used. It is used to determine the current rating, when this rating falls below the package limit.
